COVID-19 Contact Confirming App

(Abbrev: COCOA)

COVID-19 Contact Confirming Application

The COCOA is a smartphone app used to trace contact you may have made with someone infected with Covid-19 via notifications.

Any contact you meet are detected after 15 minutes of contact within 1 meter (~3ft.) of proximity.

- This app uses Bluetooth technology to alert you if you have made contact with someone infected with Covid-19. In order to protect users' privacy, neither party will know who is infected.
- It is our hope that if you use this app you can quickly seek proper medical attention if you know when you make contact with an infected person, and the spread of Covid-19 will lessen as a result.

- Contact records are saved to the device and are not used or stored anywhere else.
- Location, time, and identity will be kept private to both parties.

- * All data will be recorded as randomized symbols.
- * Information will become unavailable after 14 days.
- * Identifying information such as contact information and GPS location will not be saved.
- * If Bluetooth is turned off, no data will be saved.
